Research Interests

I lead a research program centered on investigating the drivers of galaxy formation and evolution in extreme cosmic environments — from massive galaxy clusters in the nearby cosmos to overdense galaxy protoclusters in the distant universe. My work integrates computational methods, cosmological simulations, and multi-wavelength observations, and has contributed to advancing our understanding of the processes that fuel star formation in galaxies and the mechanisms that shut it down, across a wide array of environments and cosmic epochs. Alongside leading world-class science, I actively work to create inclusive STEM spaces, particularly for individuals from historically excluded backgrounds, as diversity of thought is essential to scientific progress.
